# 1 BASIC OVERVIEW AND DIMENSIONS

The 4x8 lean Shed is an exquisite and smart shed for anyone who doesn't want a huge structure in their garden. This shed has enough space to accommodate your gardening supplies and at the same time be a beautiful addition to your garden. The overall width of the shed from the front is 8 feet from the bottom plate and 8 feet and 1 inch from the top plate. The side measurements are 9 feet and 4 inches in height and 4 feet and 1 inch in width. There is a double door in front with 5 feet and 7 inches width and 6 feet and 1.5 inches height.

**FRONT VIEW**

**SIDE VIEW**

**DOOR**

## NOTE

Use old doors and windows to save money. Follow manufacturer's instructions to accurately install the doors and windows.

## 2 FOUNDATION AND FLOOR

The first step of building this 4x8 lean Shed is building the foundation and the floor. Note that the foundation needs to be extremely resilient as it will be carrying the entire weight of the shed. You will use pressure treated timber to create a foundation with a width of 4 feet and length of 8 feet. Once you have built the foundation, you will lay the foundation over it using  $\frac{3}{4}$  inches thick tongue and groove plywood.

FOUNDATION BASE

FLOOR

### NOTE

Buy pre-designed joists and skids if you are new to building sheds. This way, you will reduce the chances of any complications in sizing and spacing.

### 3 WALL STRUCTURES

Once you have built the foundation and laid the flooring, the next step is to start building the right and left wall. The overall width of both the walls would be 4 feet from the top plate and 3 feet and 9 inches from the bottom plate. The overall height will be around 6 feet and 7.5 inches. You will use pressure treated timber to create the joists and skids for the walls. Use 3.5 inches galvanized nails to attach the parts together.

#### NOTE

Add self-adhering flashing on the bottom edges of the windows before installing T1-11.

## 4 WALL STRUCTURES

Once you are done with the right and left wall, next in line is to build the back and front wall. The height of the front wall should be 6 feet and 7.5 inches while the back wall's height should be 7 feet and 7.5 inches. The width of both the walls should be 8 feet. Use pressure treated timber to build the joists and skids of the wall. On the front wall, leave the space for the door.

### NOTE

Make sure the edges of T1-11 do not overlap each other as this will compromise the functioning and appearance of the T1-11.

## 5 ROOF SECTION

Once you have built and set up all the walls, you should start working on the roof of the shed. You will create the roof foundation with rafters. The overall width of the roofing foundation should be 8 feet and the length should be 4 feet and 7 inches. Once done, lay asphalt shingles on the roof after applying roof sheathing.

### NOTE

Follow the manufacturer's instructions carefully while installing the shingles. Get additional help for the roofing task to safely get the job done.
